REASONS FOR ALLOWANCE

The independent claims are being construed as a food component containing cartridge for preparing a fluid food component that is capable of being ruptured by protruding hollowed out elements of an extraction cage upon injection of a fluid at at least a rupturing pressure and wherein the cartridge includes a container, the food component therein and a barrier adjacent the food component and wherein the container and the barrier are configured to be punctured by an injection needle and the barrier is configured for resealing itself against leakage upon withdrawal of the needle.

Although there are many examples of medical containers and test tubes that employ puncturable resealable covers(for example, septum valves), the addition of a resealable barrier to a fluid food preparing cartridge to address the problem of leakage is not suggested by the art taken as a whole. In fact, the art taken as a whole does not even address the problem of leakage in the environment of a liquid food preparing cartridge that employs fluid injection pressure.
